What is the physics behind q? If S leads to  $q \neq 1$ , what K(S) achieves  $q_K =$ 

# Ideal Gas: microcanonical statistical weight

The one-particle energy,  $\omega$ , out of total energy, *E*, is distributed in a one-dimensional relativistic jet according to a statistical weight factor which depends on the number of particles in the reservoir, *n*:

$$P_{1}(\omega) = \frac{\Omega_{1}(\omega) \Omega_{n}(E - \omega)}{\Omega_{n+1}(E)} = \rho(\omega) \cdot \frac{(E - \omega)^{n}}{E^{n}}$$
(1)

**Superstatistics**: *n* itself has a distribution (based on the physical model of the reservoir and on the event by event detection of the spectra).

< ロ > < 同 > < 三 > < 三 > :

What is the physics behind q? If *S* leads to  $q \neq 1$ , what K(S) achieves  $q_K = 1$ 

# Ideal Reservoir: (Negative) binomial *n*-distribution

*n* particles among *k* cells: bosons  $\binom{n+k}{n}$  fermions  $\binom{k}{n}$ A subspace (n, k) out of (N, K)Limit:  $K \to \infty$ ,  $N \to \infty$ ; average occupancy f = N/K is fixed.

$$B_{n,k}(f) := \lim_{K \to \infty} \frac{\binom{n+k}{n} \binom{N-n+K-k}{N-n}}{\binom{N+K+1}{N}} = \binom{n+k}{n} f^n (1+f)^{-n-k-1}.$$
(2)

$$F_{n,k}(f) := \lim_{K \to \infty} \frac{\binom{k}{n}\binom{K-k}{N-n}}{\binom{K}{N}} = \binom{k}{n} f^n (1-f)^{k-n}.$$
 (3)

GNEF

What is the physics behind q? If S leads to  $q \neq 1$ , what K(S) achieves  $q_K = 1$ 

## Bosonic reservoir

Reservoir in hep: E is fixed, n fluctuates, e.g. according to NBD.

$$\sum_{n=0}^{\infty} \left(1 - \frac{\omega}{E}\right)^n B_{n,k}(f) = \left(1 + f\frac{\omega}{E}\right)^{-k-1}$$
(4)

Note that  $\langle n \rangle = (k + 1)f$  for NBD. Then with  $T = E / \langle n \rangle$  and  $q - 1 = \frac{1}{k+1}$  we get

$$\left(1+(q-1)\frac{\omega}{T}\right)^{-\frac{1}{q-1}}$$

This is **exactly** a q > 1 Tsallis-Pareto distribution.

イロン 不得入 不良人 不良人 一度

Gner

What is the physics behind q? If S leads to  $q \neq 1$ , what K(S) achieves  $q_K = 13$ 

# Fermionic reservoir

*E* is fixed, *n* is distributed according to BD:

$$\sum_{n=0}^{\infty} \left(1 - \frac{\omega}{E}\right)^n F_{n,k}(f) = \left(1 - f\frac{\omega}{E}\right)^k$$
(5)

Note that  $\langle n \rangle = kf$  for BD. Then with  $T = E / \langle n \rangle$  and  $q - 1 = -\frac{1}{k}$  we get

$$\left(1+(q-1)\frac{\omega}{T}\right)^{-\frac{1}{q-1}}$$

This is **exactly** a q < 1 Tsallis-Pareto distribution.

イロト イポト イヨト イヨト

SNEF

What is the physics behind q ? If S leads to  $q \neq 1$ , what K(S) achieves  $q_K = 1$ 

# Boltzmann limit

In the  $k \gg n$  limit (low occupancy in phase space)

$$\binom{n+k}{n}f^{n}(1+f)^{-n-k-1} \longrightarrow \frac{k^{n}}{n!}\left(\frac{f}{1+f}\right)^{n} \cdots$$
$$\binom{k}{n}f^{n}(1-f)^{k-n} \longrightarrow \frac{k^{n}}{n!}\left(\frac{f}{1-f}\right)^{n} \cdots$$
(6)

After normalization this is the **Poisson** distribution:

$$\Pi_n = \frac{\langle n \rangle^n}{n!} e^{-\langle n \rangle} \quad \text{with} \quad \langle n \rangle = k \frac{f}{1 \pm f}$$
(7)

The result is **exactly** the Boltzmann-Gibbs weight factor:

$$\sum_{n=0}^{\infty} \left(1 - \frac{\omega}{E}\right)^n \Pi_n(\langle n \rangle) = e^{-\omega/T}.$$
 (8)

 $k \approx 10-20 \quad \rightarrow \quad q \approx 1.05-1.10.$ 

What is the physics behind q? If *S* leads to  $q \neq 1$ , what K(S) achieves  $q_K = \frac{1}{2}$ 

## Summary of ideal reservoir fluctuations

#### In all the three above cases

$$T = \frac{E}{\langle n \rangle}$$
, and  $q = \frac{\langle n(n-1) \rangle}{\langle n \rangle^2}$  (9)

イロン イボン イヨン イヨン

What is the physics behind q ? If S leads to  $q \neq 1$ , what K(S) achieves  $q_K = 1$ 

# Ideal gas with general *n*-fluctuations

Canonical approach: expansion for small  $\omega \ll E$ . Tsallis-Pareto distribution as an approximation:

$$\left(1+(q-1)\frac{\omega}{T}\right)^{-\frac{1}{q-1}} = 1-\frac{\omega}{T}+q\frac{\omega^2}{2T^2}-\dots$$
 (10)

Ideal reservoir phase space up to the subleading canonical limit:

$$\left\langle \left(1-\frac{\omega}{E}\right)^n\right\rangle = 1-\left\langle n\right\rangle \frac{\omega}{E} + \left\langle n(n-1)\right\rangle \frac{\omega^2}{2E^2} - \dots$$
 (11)

#### To subleading in $\omega \ll E$

$$\mathbf{T} = \frac{\mathbf{E}}{\langle \mathbf{n} \rangle}, \qquad \mathbf{q} = \frac{\langle \mathbf{n}(\mathbf{n}-\mathbf{1}) \rangle}{\langle \mathbf{n} \rangle^2} = \mathbf{1} - \frac{1}{\langle \mathbf{n} \rangle} + \frac{\Delta n^2}{\langle \mathbf{n} \rangle^2}. \quad (12)$$

٦C

What is the physics behind q? If *S* leads to  $q \neq 1$ , what K(S) achieves  $q_K = 1$ 

# wigner

## General system with general reservoir fluctuations

Canonical approach: expansion for small  $\omega \ll E$ .

$$\left\langle \frac{\Omega_n(E-\omega)}{\Omega_n(E)} \right\rangle = \left\langle e^{S(E-\omega)-S(E)} \right\rangle = \left\langle e^{-\omega S'(E)+\omega^2 S''(E)/2-\dots} \right\rangle$$

$$= 1 - \omega \left\langle S'(E) \right\rangle + \frac{\omega^2}{2} \left\langle S'(E)^2 + S''(E) \right\rangle - \dots$$
(13)

Compare with expansion of Tsallis

$$\left(1+(q-1)\frac{\omega}{T}\right)^{-\frac{1}{q-1}} = 1-\frac{\omega}{T}+q\frac{\omega^2}{2T^2}-\dots$$
 (14)

#### Interpret the parameters

$$\frac{1}{T} = \langle S'(E) \rangle, \qquad q = 1 - \frac{1}{C} + \frac{\Delta T^2}{T^2}$$
(15)

 $\langle S''(E) \rangle = -1/CT^2$ 

expressed via the heat capacity of the reservoir, 1/C = dT/dE

What is the physics behind q? If *S* leads to  $q \neq 1$ , what K(S) achieves  $q_K =$ 

## Understanding the parameter q

in terms fluctuations

イロト イポト イヨト イヨト

Opposite sign contributions from  $\langle S'^2 \rangle - \langle S' \rangle^2$  and from  $\langle S'' \rangle$ . In all cases approximately

$$q=1-rac{1}{C}+rac{\Delta T^2}{T^2}.$$

- q > 1 and q < 1 are both possible
- for any relative variance  $\Delta T/T = 1/\sqrt{C}$  it is exactly q = 1
- for  $nT = E/\dim = \text{const}$  it is  $\Delta T/\langle T \rangle = \Delta n/\langle n \rangle$ .
- for ideal gas and n distributed as NBD or BD, the Tsallis form is exact

What is the physics behind q? If *S* leads to  $q \neq 1$ , what K(S) achieves  $q_K = 1$ ?

# K(S) additive S non-additive

Use K(S) instead of S to gain more flexibility for handling the subleading term in  $\omega$ !

$$\left\langle e^{K(S(E-\omega))-K(S(E))} \right\rangle = 1 - \omega \left\langle \frac{d}{dE} K(S(E)) \right\rangle$$
$$+ \frac{\omega^2}{2} \left\langle \frac{d^2}{dE^2} K(S(E)) + \left( \frac{d}{dE} K(S(E)) \right)^2 \right\rangle + \dots$$
(16)

Note that

$$\frac{d}{dE}K(S(E)) = K'S', \qquad \frac{d^2}{dE^2}K(S(E)) = K''S'^2 + K'S'' \quad (17)$$

Compare this with the Tsallis power-law!

ner

What is the physics behind q? If *S* leads to  $q \neq 1$ , what K(S) achieves  $q_K = 1$ ?

# Tsallis parameters for K(S) entropy

Using previous average notations and assuming that K(S) is independent of the reservoir fluctuations (*universality*):

$$\frac{1}{T_{K}} = K' \frac{1}{T},$$

$$\frac{q_{K}}{T_{K}^{2}} = \left(K'' + K'^{2}\right) \frac{1}{T^{2}} \left(1 + \frac{\Delta T^{2}}{T^{2}}\right) - K' \frac{1}{CT^{2}}.$$
 (18)

By choosing a particular K(S) we can manipulate  $q_k$ .

イロト イポト イヨト イヨト

ner

What is the physics behind q? If *S* leads to  $q \neq 1$ , what K(S) achieves  $q_K = 1$ ?

# $q_{K}$ parameter for K(S) entropy

Introduce  $F = 1/K' = T_K/T$  and  $\Delta T^2/T^2 = \lambda/C$ .

Then

$$q_{\mathcal{K}} = \left(1 + \frac{\lambda}{C}\right) \left(1 - F'\right) - \frac{1}{C}F \qquad (19)$$

delivers the simple diff.eq.

$$(\lambda + C)F' + F = \lambda + C(1 - q_K) = 1 + C(q - q_k).$$
 (20)

With F(0) = 1 the only solution for  $q_K = q$  is F = 1, K(S) = S.

SACL

What is the physics behind q? If *S* leads to  $q \neq 1$ , what K(S) achieves  $q_K = 1$ ?

## Deformed entropy formula

T.S.Biró, P.Ván, G.G.Barnaföldi, EPJA 49: 110, 2013

イロン 不得入 不良人 不良人 一度

For ideal gas *C* is constant, without reservoir fluctuations q = 1 - 1/C and C = 1/(1 - q).

The solution of eq.(23) with K(0) = 0, K'(0) = 1 delivers

$$K(S) = C\left(e^{S/C} - 1\right) \tag{24}$$

and one arrives upon using  $K(S) = \sum_{i} p_i K(-\ln p_i)$  at the statistical entropy formulas of Tsallis and Rényi:

$$K(S) = \frac{1}{1-q} \sum_{i} (p_{i}^{q} - p_{i}), \qquad S = \frac{1}{1-q} \ln \sum_{i} p_{i}^{q}$$
 (25)

iner

What is the physics behind q? If *S* leads to  $q \neq 1$ , what K(S) achieves  $q_K = 1$ ?

## Deformed formula with C and $\lambda$ constant

Demanding  $q_{K} = 1$ , due to F = 1/K' one obtains in general the diff.eq.

$$\lambda \mathcal{K}^{\prime 2} - \mathcal{K}^{\prime} + (\mathcal{C} + \lambda) \mathcal{K}^{\prime\prime} = 0.$$
<sup>(26)</sup>

**First integral** (with constant  $\lambda$  and  $C_{\Delta} = \lambda + C$ )

$$K'(S) = \frac{1}{(1-\lambda)e^{-S/C_{\Delta}} + \lambda}$$
(27)

#### Second integral of the DE

$$K(S) = \frac{C_{\Delta}}{\lambda} \ln\left(1 - \lambda + \lambda e^{S/C_{\Delta}}\right).$$
(28)

 $\odot$ 

・ロン ・同 とくほう ・ ほう 一 臣

Migner

What is the physics behind q? If *S* leads to  $q \neq 1$ , what K(S) achieves  $q_K = 1$ ?

# K(S)-additive composition rule

With the result (28) the K(S)-additive composition rule,  $K(S_{12}) = K(S_1) + K(S_2)$ , is equivalent to

$$h(S_{12}) = h(S_1) + h(S_2) + \frac{\lambda}{C_{\Lambda}}h(S_1)h(S_2)$$
 (29)

with

$$h(S) = C_{\Delta} \left( e^{S/C_{\Delta}} - 1 \right).$$
(30)

イロト イポト イヨト イヨト

This is a combination of the ideal gas entropy-deformation, h(S) and an Abe – Tsallis composition law with  $q - 1 = \lambda/C_{\Delta}$ .

חפר

What is the physics behind q? If S leads to  $q \neq 1$ , what K(S) achieves  $q_K = 1$ ?

#### Non-extensive limit?

Using the auxiliary  $h_C(S) = C(e^{S/C} - 1)$  function,

our result is

$$\mathbf{K}_{\lambda}(\mathbf{S}) = \mathbf{h}_{\mathbf{C}_{\Delta}/\lambda}^{-1}\left(\mathbf{h}_{\mathbf{C}_{\Delta}}(\mathbf{S})
ight).$$

For  $\lambda = 1$  it is obviously  $K_1(S) = S$ . For  $\lambda = 0$  we get  $K_0(S) = h_C(S)$ .

A particular limit:  $C \to \infty, \lambda \to \infty$  but  $\lambda/C_{\Delta} \to \tilde{q} - 1$  finite:

$$K_{NE}(S) = h_{1/(\tilde{q}-1)}^{-1}(S) = \frac{1}{\tilde{q}-1} \ln(1+(\tilde{q}-1)S).$$
 (31)

K-additivity:  $S_{12} = S_1 + S_2 + (\tilde{q} - 1)S_1S_2$ 

= 990

.

イロト イポト イヨト イヨト

<u>Úigner</u>

## Summary

- Ideal gas reservoirs with NBD or BD number fluctuations lead to exact Tsallis distributions:  $q = 1 + \frac{1}{k+1}$  and  $q = 1 \frac{1}{k}$ .
- Tsallis distribution is the approximate canonical weight with fluctuating reservoirs:  $q = 1 1/C + \Delta T^2/T^2$ .
- A general method (UTI) is presented to derive optimally additive entropy: K(S) for  $q_K = 1$ .
- New entropy formula; for infinite temperature fluctuations at finite heat capacity it is *parameter – free.*

$$K(S) = \sum_i p_i \ln (1 - \ln p_i).$$
